

RFH — Requests for Hacks

Agentic Commerce Hackathon is a 48-hour online build focused on AI products that go beyond answering questions. Build a working experience where an agent can understand intent, find the right option and complete a purchase, booking, renewal or payment using Prava.

How to use this list

These RFHs are starting points, not specifications. We do not expect you to build any idea exactly as written. Treat this as a non-exhaustive list: narrow one to a specific user, combine several, or use them to spark something completely different.

Ideas to build

1. Shoppable creator links

Turn a creator's outfit, product roundup or recommendation into one shareable shopping experience. Let followers discover and purchase products from different merchants without moving through a trail of redirects.

2. AI shopping or styling agent

Build an agent that understands a user's taste, budget or occasion, finds the right products and completes the purchase. It could focus on fashion, gifts, home, groceries or another category.

3. **Multi-store marketplace**

Bring products from Shopify and other merchants into one useful interface. Help users compare, decide and buy across stores without repeating the checkout process.

4. **Travel or local concierge**

Turn a request into a completed booking for a flight, stay, restaurant or local experience. Focus on one complete journey instead of trying to cover every part of travel.

5. **Personal messaging assistant**

Build an assistant inside iMessage, chat or another familiar interface that can book a table, order an item or complete an everyday errand for the user.

6. **Subscription or financial agent**

Help users understand, renew, switch, pause or cancel subscriptions. The agent could also manage bills or complete an approved payment when action is needed.

7. **Health and wellness commerce**

Connect a nutrition, fitness or calorie-tracking experience to useful products or services. The agent could help users find and purchase supplements, food or wellness services.

8. **B2B procurement workflow**

Build an agent that can purchase software, source services, manage vendors, pay invoices or handle employee spending as part of a business workflow.

9. **Limited-drop buying agent**

Help users buy sneakers, collectibles, tickets or other limited-release products based on their preferences, budget and timing.

10. **Agent-native marketplace**

Build a product where an agent can buy tools, data or services from other agents and APIs to complete a task or deliver an outcome to a customer.

What is Prava?

Prava is the payments and trust layer for AI agents. It lets builders add agent-led purchasing and payments to their products through APIs, SDKs, MCP and CLI tools.

Prava in your hack

Prava should be a meaningful part of the product and help the agent complete the transaction. It should not feel like a disconnected checkout added at the end.
